Errors Associated with FIJI's Auto-Updater

The most common cause of these errors is that FIJI has been installed in a directory where it does not have "write permission" and therefore cannot update itself. Typically, this means that FIJI has been installed in the Program Files directory on a PC or the Applications folder on a Mac.

This problem is easily rectified:

1. Locate the FIJI folder or App and copy it.
2. Navigate to your home directory:
    o This will be C:\users\<*your user name*> on a PC or /Users/<*your user name*> on a Mac.
3. Create a new folder.
4. Paste the FIJI folder/App inside this new folder.
5. Delete the old FIJI installation in Program Files or Applications.
6. When you launch FIJI from it's new location, it should be able to update itself without any problems.
